SECURE CLIENT - BOOT PROCESS

1. Initial Stage I Boot (B1) from Boot ROM

2. Public Key (PK) read from BOOT ROM

3. HDD Code Image (B2 & App) signature (S) is verified with public key (PK)

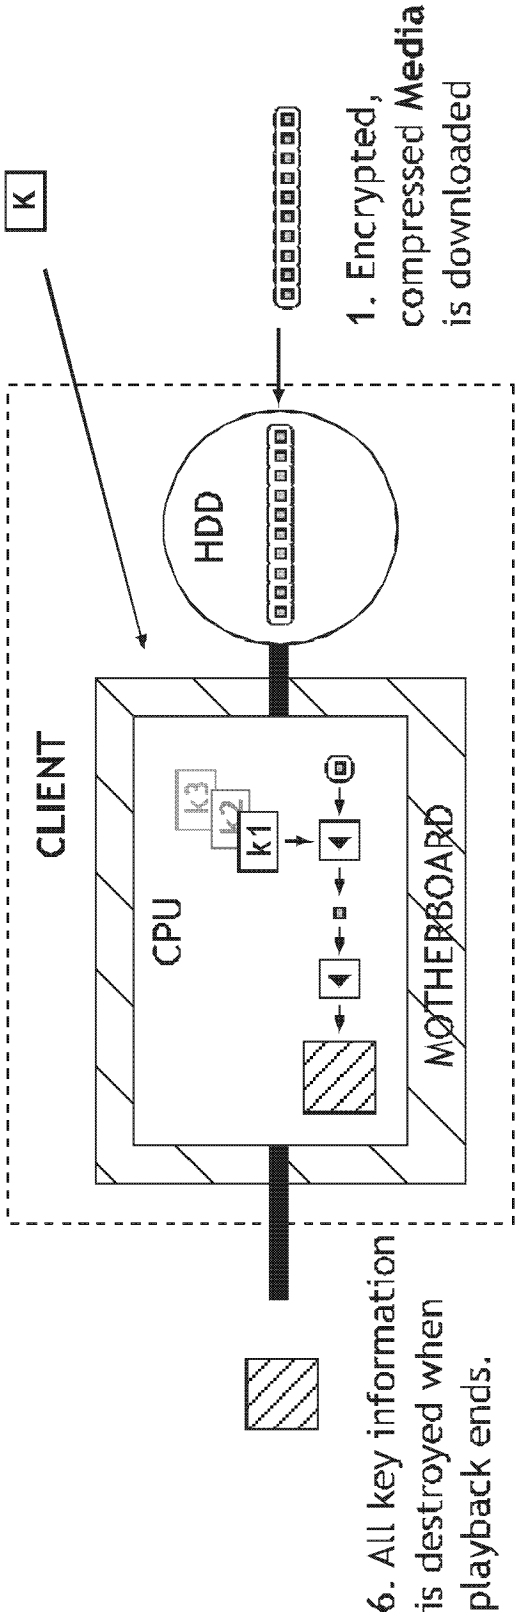

4A. If signature is verified, Stage II boot (B2) continues from HDD, application execution (App) commences.

4B. If signature does not verify, fallback code (B2') is used from Boot ROM. System will require service.

FIG. 13

SECURE CLIENT - PLAYBACK

3. After the Media Pass negotiation, **Key (K)** is delivered to the **Client**

1. Encrypted, compressed **Media** is downloaded

2. Media is stored on HDD

4. Media is decrypted (on-chip SW or HW). Decrypted, compressed media **never** appears outside CPU

5. Each frame is decompressed frame by frame with indexed decryption keys (k1, k2, k3, ...)
